

ProjectSync — macOS Deployment Guide

Push to GitHub & Host on Vercel (Step-by-Step for Mac)

Prerequisites

Make sure you have:

- A GitHub account (free): <https://github.com/signup>
 - Git installed on your Mac (usually pre-installed)
 - Your ProjectSync files ready: `index.html`, `app.js`, `vercel.json`, `.gitignore`
-

Step 1: Open Terminal

Press `Cmd + Space`, type “Terminal”, press Enter.

Or find Terminal in: **Applications** → **Utilities** → **Terminal**

Step 2: Navigate to Your Project Folder

```
# Replace this with YOUR actual folder path
# If your files are in Downloads/projectsync:
cd ~/Downloads/projectsync

# Or if they're on Desktop:
# cd ~/Desktop/projectsync

# Or if you created a folder in Documents:
# cd ~/Documents/projectsync
```

Tip: You can also drag your folder into the Terminal window and it will auto-fill the path.

Step 3: Initialize Git

```
# Check if Git is installed
git --version

# If you see something like "git version 2.39.0", you're good
# If not, install it: xcode-select --install

# Initialize Git in this folder
git init
```

You'll see: Initialized empty Git repository in ...

Step 4: Add Your Files

```
# Add all files to Git
git add .

# Check what was added
git status
```

You should see:

```
new file:   .gitignore
new file:   app.js
new file:   index.html
new file:   vercel.json
```

Step 5: Commit Your Files

```
git commit -m "Initial ProjectSync commit - international student project manager"
```

You'll see something like:

```
[main (root-commit) abc1234] Initial ProjectSync commit
4 files changed, 1500 insertions(+)
```

Step 6: Create GitHub Repository

1. Go to <https://github.com> in your browser
2. Click the + icon (top right) → **New repository**
3. **Repository name:** projectsync
4. **Description:** Student project management app - built with Supabase & Vercel
5. Keep it **Public** (so Vercel can access it)
6. **DO NOT** check “Add a README” or “Add .gitignore” (you already have these)
7. Click **Create repository**

You'll see a page with instructions. Look for the section that says:

```
...or push an existing repository from the command line
```

Copy the two lines shown (they'll look like this):

```
git remote add origin https://github.com/YOUR_USERNAME/projectsync.git
git branch -M main
git push -u origin main
```

Step 7: Push to GitHub

Back in Terminal, paste those three lines:

```
git remote add origin https://github.com/YOUR_USERNAME/projectsync.git
git branch -M main
git push -u origin main
```

It will ask for your GitHub credentials.

If it asks for username/password:

- **Username:** Your GitHub username
- **Password:** Use a **Personal Access Token** (not your actual password)

How to Create a Personal Access Token:

1. Go to <https://github.com/settings/tokens>
2. Click **Generate new token (classic)**
3. **Note:** ProjectSync Deploy
4. **Expiration:** No expiration (or 90 days)
5. **Scopes:** Check only repo
6. Click **Generate token**
7. **COPY THE TOKEN IMMEDIATELY** (you can't see it again!)
8. Paste it as your password in Terminal

After pushing, you'll see:

```
Enumerating objects: 7, done.
Counting objects: 100% (7/7), done.
Delta compression using up to 8 threads
Compressing objects: 100% (7/7), done.
Writing objects: 100% (7/7), 45.00 KiB | 15.00 MiB/s, done.
Total 7 (delta 0), reused 0 (delta 0), pack-reused 0
To https://github.com/YOUR_USERNAME/projectsync.git
 * [new branch]      main -> main
branch 'main' set up to track 'origin/main'.
```

✅ **Your code is now on GitHub!**

Step 8: Deploy to Vercel

Option A: Vercel Website (Easiest)

1. Go to <https://vercel.com>
2. Click **Sign Up** → **Continue with GitHub**
3. Authorize Vercel to access your GitHub
4. On the Vercel dashboard, click **Add New Project**
5. Find projectsync in the list → Click **Import**
6. Vercel will auto-detect it's a static site
7. **Framework Preset:** Leave as "Other"

8. Click **Deploy**

Wait ~30 seconds...

🎉 **Done!** You'll get a URL like:

```
https://projectsync.vercel.app
```

Option B: Vercel CLI (Terminal)

```
# Install Vercel CLI globally
npm install -g vercel

# Login (opens browser)
vercel login

# Deploy
vercel --prod
```

Follow the prompts:

- **Set up “~/projectsync”?** → Yes
- **Which scope?** → Your username
- **Link to existing project?** → No
- **What's your project name?** → projectsync

It will deploy and give you a URL.

Step 9: Update Supabase with Your Vercel URL

1. Go to your Supabase Dashboard
 2. **Authentication** → **URL Configuration**
 3. Add your Vercel URL:
 - **Site URL:** `https://projectsync.vercel.app`
 - **Redirect URLs:** `https://projectsync.vercel.app/**`
 4. Click **Save**
-

Step 10: Test Your Live App

1. Open `https://projectsync.vercel.app` in your browser
 2. Try signing in with Google
 3. Create a test project
 4. Invite a friend using the share link
-

Making Updates (After Initial Deploy)

Whenever you change your code:

```
cd ~/Downloads/projectsync # or wherever your folder is
git add .
git commit -m "Describe your changes here"
git push origin main
```

Vercel auto-deploys every time you push to GitHub!

Troubleshooting

Problem	Solution
git: command not found	Run <code>xcode-select --install</code>
fatal: not a git repository	Run <code>git init</code> first
Authentication failed	Use Personal Access Token, not password
Vercel shows 404	Make sure <code>vercel.json</code> is in your repo
Google auth fails	Check Supabase URL Configuration matches your Vercel URL
Files not updating	Check <code>git status</code> to see if changes are staged

Your Final Folder Structure

```
projectsync/
├── .git/           # Git tracking (auto-created)
├── .gitignore      # Tells Git what to ignore
├── index.html      # Main UI
├── app.js          # App logic
├── vercel.json     # Vercel config
└── supabase_setup.sql # Database schema (not deployed, keep for reference)
```

Next Steps

1. **Share your URL** with classmates for testing
2. **Post on social media** (TikTok, Instagram, Twitter/X)
3. **Get feedback** and iterate
4. **Apply to startup competitions** in Malaysia
5. **Scale globally** — your app works in any language now!

Built with ❤️ on macOS by a student at SMK Bukit Mertajam
